

Muhlenkamp & Company, Inc.

Quarterly Letter, October 2018

Fellow investors,

At the end of the third quarter the U.S. economy is by most indicators in good shape. Real (inflation adjusted) GDP growth the first two quarters averaged 3% and forecasts are for the full year to come in at about 3%. Small business and consumer sentiment indicators are at high levels. Unemployment is quite low and most credit metrics are looking fine. Companies are bringing overseas cash back home and are, in general, doing three things with it: investing in their business, sharing it with employees, and sharing it with owners (the mix varying a bit by company). If you are looking for reasons to be optimistic the domestic economy provides plenty of them.

There are also some reasons to worry (there always are). Domestically, the worries center on inflation (which is approaching 3%) and rising short-term interest rates. Long-term interest rates haven't really done much all year, which is somewhat surprising given good economic growth and 3% inflation. Rising short-term interest rates are being driven by the Federal Reserve which kept the Federal Funds Rate near zero from 2009 until 2015 and is now steadily raising that rate to get back to what they consider "normal." There are two problems with this: no one is quite sure what "normal" is anymore (more precisely, the interest rate that neither spurs nor retards economic growth—a neutral rate) and there is the distinct possibility that some businesses have become accustomed to very low interest rates and will not survive in a higher rate environment. So the Fed is feeling its way along, slowly raising the Federal Funds Rate and reducing the assets they hold, hoping they don't disrupt economic growth. Higher inflation will put the Federal Reserve on the horns of a dilemma, which is why it is a worry. The Federal Reserve has a target of 2% inflation, which we are now above. At some inflation level the Fed will feel compelled to raise rates more rapidly to fight inflation which would increase the odds of slowing the economy and would be negative for asset markets. So it is entirely possible that, despite their best intentions, the Federal Reserve's monetary policy either creates problems in an economy dependent on cheap credit, or spurs higher inflation first, then chokes the economy to curb the inflation they stoked. Currently we have 3% real economic growth and 3% inflation—so far so good.

Internationally, we find more reasons for worry than reasons for optimism. First, the strong dollar is creating problems for countries that borrowed a lot of dollars. This has exacerbated existing problems in a number of countries and we've seen their currencies plummet, most notably Argentina and Turkey. The potential exists for them to default on their dollar denominated loans which would impair the banks and others that lent them the money. At the extreme, those defaults could ripple through the international banking system and create a wider problem. That's not what we expect to happen, but we are watching for the early warning signs that something like that is occurring.

Second, on a global basis, monetary policy continues to move back towards normal as central banks end their extraordinary policies. You may recall that the central banks of the U.S., Europe, and Japan all dropped interest rates to essentially zero and implemented asset buying programs in order to spur economic growth and generate inflation. The U.S. Federal Reserve was the first to start moving back towards normal by ending their asset purchase program in 2014, raising short-term rates beginning in 2015, and reducing their assets beginning in 2017. The European Central Bank (ECB) is the second major central bank to move back towards normal. The ECB has announced it will end its asset purchase program in December 2018 and will look to begin raising rates perhaps in mid to late 2019. We think this will allow interest rates in Europe to rise which will reduce upward pressure on the dollar and create downward pressure on U.S. long-term interest rates. This is a big step towards tighter money on a global basis.

We think the loose central bank policies inflated pretty much all asset prices around the world. Additionally, all kinds of borrowers have taken advantage of the abundance of cheap money—countries, companies, and individuals. We expect the withdrawal of that monetary support to exert downward pressure on asset prices and are concerned that some of those borrowers will not be able to support the debt they took on. It's a big

Muhlenkamp & Company, Inc.

shift and it will take time to unfold and time for the problems to become manifest, but we are four years into it with another big move coming. We think the plunging currencies of Turkey and Argentina are first of the problems that will unfold in this tighter monetary environment.

The above is really a reiteration of what we've been saying all year. A strong U.S. economy boosted by changes in the tax code and reduced regulations is a positive force in the markets. The shift from a very loose monetary environment to something less loose is a negative. We said at the beginning of the year that these two drivers (strong U.S. economy & the tightening of the money supply) would shape the markets in a fashion we couldn't predict.

In March, President Trump injected a wild card as he seeks to restructure the trading relationships between the U.S. and other countries. In general, the pattern seems to be for the U.S. to unilaterally levy tariffs on imports until we convince the other party to sit down and seriously bargain. Some countries came to the table after the first round of tariffs: Korea and Japan. Others came right back at us with their own tariff schemes for a round or two then sat down: Mexico, Canada, and the European Union. We have yet to get China to the bargaining table after what is, by my count, four rounds of tariffs and counter-tariffs. So far, the markets haven't reacted much to this activity, but the potential remains for global trade (and by extension global growth) to be significantly affected. So we've added "Trade" to our worry list and we're incorporating it in our thinking. We'll keep you posted.

So far this year, we've done more selling than buying and are holding a bit more cash than we were at the start of the year. This activity has been bottom up driven: a number of our holdings met our sell criteria and so were reduced or sold and the number of buying opportunities has been low. We are comfortable holding a little more cash given the change in the monetary environment and will put that cash to work when we find a lucrative opportunity.

Until next quarter...

Ron Muhlenkamp and Jeff Muhlenkamp

The comments made by Ron and Jeff Muhlenkamp in this commentary are opinions and are not intended to be investment advice or a forecast of future events.

Central Bank is the entity responsible for overseeing the monetary system for a nation (or group of nations). The central banking system in the U.S. is known as the Federal Reserve (commonly referred to "the Fed"), composed of twelve regional Federal Reserve Banks located in major cities throughout the country. The main tasks of the Fed are to supervise and regulate banks, implement monetary policy by buying and selling U.S. Treasury bonds, and steer interest rates.

Federal Funds Rate is the interest rate at which depository institutions lend balances at the Federal Reserve to other depository institutions overnight. It is the interest rate banks charge each other for loans.

Gross Domestic Product (GDP) is the total market value of all goods and services produced within a country in a given period of time (usually a calendar year).

MuhlenkampSMA All-Cap Value

For the period ended 9/30/18

Muhlenkamp & Company's All-Cap Value SMA (Separately Managed Account) is designed for investors' accounts over \$100,000. We employ full discretion, applying fundamental analysis.

Investment Objective

We seek to maximize total after-tax return through capital appreciation, and income from dividends and interest, consistent with reasonable risk.

Investment Strategy

We invest in undervalued assets wherever they may be found. Typically, this results in holding a portfolio of companies we believe are materially undervalued by the market. Bonds may be included in the portfolio if they are a good investment.

Investment Process

We start with a bottom-up scan of domestic companies, typically looking at most U.S. companies at least four times per year. We add to that an understanding of the sector dynamics in which companies are operating, an assessment of the business cycle, and a review of macroeconomic conditions.

Our primary screening metric is return on shareholder equity (ROE). We are looking for companies with stable returns that can be purchased cheaply, or for companies with improving returns that have not yet been recognized by the market.

We don't believe that a holding period of "forever" is appropriate in all cases, but are comfortable holding companies as long as they continue to meet expectations.

Investment Risk

We define investment risk as the probability of losing purchasing power over long periods of time, which is quite different from Wall Street's definition of price volatility in very short periods of time. Taxes, inflation, and spending will ALL impact the purchasing power of your assets.

| Return | -2.21% | 1.12% | 3.78% | 4.01 | 5.23% | 4.48% |
| S&P 500 Total Return* | 10.56% | 17.91% | 17.31% | 13.95% | 11.97% | 9.65% |
| Consumer Price Index** | 2.28% | 2.70% | 1.90% | 1.52% | 1.42% | 2.10% |

* The S&P 500 is a widely recognized, unmanaged index of common stock prices. The figures for the S&P 500 reflect all dividends reinvested but do not reflect any deductions for fees, expenses, or taxes. One cannot invest directly in an index.

** Consumer Price Index (CPI) – As of August 2018 – U.S. CPI Urban Consumers NSA (Non-Seasonally Adjusted), Index. The Consumer Price Index tracks the prices paid by urban consumers for goods and services and is generally accepted as a measure of price inflation. Price inflation affects consumers' purchasing power.

Consolidated performance with dividends and other earnings reinvested. Performance figures reflect the deduction of broker commission expenses and the deduction of investment advisory fees. Such fees are described in Part II of the adviser's Form ADV. The advisory fees and any other expenses incurred in the management of the investment advisory account will reduce the client's return. It should not be assumed that recommendations made in the future will be profitable or will equal the performance of the above accounts. A list of all security recommendations made within the past twelve months is available upon request.

The objective of this All-Cap Value Composite is to maximize total after-tax return, consistent with reasonable risk—using a strategy of investing in highly profitable companies, as measured by Return on Equity (ROE), that sell at value prices, as measured by Price-to-Earnings Ratios (P/E).

Muhlenkamp & Company, Inc. ("Muhlenkamp") claims compliance with the Global Investment Performance Standards (GIPS®) and has prepared and presented this report in compliance with the GIPS standards. Muhlenkamp has been independently verified for the periods December 31, 1993 through June 30, 2016 by Ashland Partners & Company LLP and for the periods July 1, 2016 through December 31, 2017 by ACA Performance Services, LLC.

Verification assesses whether (1) the firm has complied with all the composite construction requirements of the GIPS standards on a firm-wide basis and (2) the firm's policies and procedures are designed to calculate and present performance in compliance with the GIPS standards. The All-Cap Value Composite has been examined for the periods December 31, 1993 through December 31, 2017. The verification and performance examination reports are available upon request.

Muhlenkamp is an independent registered investment advisory firm registered with the Securities and Exchange Commission. The firm's list of composite descriptions is available upon request.

Returns are based on fully discretionary accounts under management, including those accounts no longer with the firm. Composite may invest in American Depositary Receipts (ADRs).*** Accounts may be shown gross or net of withholding tax on foreign dividends based on the custodian. Past performance is not indicative of future results.

The U.S. dollar is the currency used to express performance. Returns are expressed as percentages and are presented gross and net of management fees and include the reinvestment of all income. Net of fee performance was calculated using actual management fees. The annual Composite dispersion presented is an asset-weighted standard deviation calculated for the accounts in the Composite the entire year. Policies for valuing portfolios, calculating performance, and preparing compliant presentations are available upon request.

* **Three-Year Annualized Standard Deviation** is a measure of volatility, calculated by taking the standard deviation of 36 monthly returns, then multiplying the result by the square root of 12 to annualize it. Since standard deviation measures the dispersion of a set of numbers from its mean, higher results indicate more variation in monthly returns over the trailing three years.

** **Composite Dispersion** is a measure of the similarity of returns among accounts in the Composite. It is the standard deviation of the annual returns for all accounts which were in the Composite for the entire year.

*** **American Depositary Receipts (ADRs)** are shares that trade in U.S. markets, but represent shares of a foreign company. A bank (the depository) purchases a number of the foreign shares and holds them in a trust or similar account; in turn, the bank issues shares tradable in the U.S. that represent an interest in the foreign company. The ratio of ADRs to foreign shares is set by the bank. ADRs do not mitigate currency risk, but can reduce transaction costs and simplify trading compared to buying the local shares in the foreign markets.
